

ABSTRACT OF THE DISCLOSURE

A liquid dispensing system comprises a liquid dispensing device and a light source that is attached to or located within a close proximity of the liquid dispensing device. Light emitted from the light source illuminates an area in close proximity to the liquid dispensing device. Such light can aid a user by increasing the visibility of various components of the liquid dispensing system. Further, such light can improve the aesthetic appearance of the liquid dispensing system, particularly when the liquid dispensing system is located in an otherwise dimly lit area.
